----------------------------	----------------------------	--------------------------	-------------------------	-------------------------------------

What can management improve based on this dashboard?

1. **Improve Operational Efficiency & Capacity**

- Hire more staff or extend working hours to reduce patient waiting times.
- Use an automated cancellation and waitlist system to quickly fill empty appointment slots and avoid wasted time.

2. **Increase Revenue**

- October 2025 and February 2026 had the highest revenue, likely because of seasonal demand for more expensive treatments and check-ups.
- Increase marketing efforts before these peak months (September and January) to attract more patients.
- Avoid approving staff vacations during peak periods and consider temporary administrative support to handle higher patient volume.

3. **Review Customer Retention & Engagement**

- The follow-up rate is good overall (51.4%), but both appointments and follow-ups dropped sharply in March 2026.
- Management should review patient records to make sure doctors are recommending necessary follow-up visits.
- Send automatic email or SMS reminders to patients about follow-up appointments and treatment plans.

4. **Resource Allocation**

- The busiest days reached 7 appointments, especially during late autumn and early January.
- Use past trends to prepare staffing levels during busy periods and avoid approving leave during these times.
- Encourage patients to book on historically slower days by offering small discounts or incentives to balance demand.

Department Performance

Neurology Busiest Department	Neurology Top Department by Revenue	General Top Department by Follow-Up Rate	General Top Department by Waiting Days
--	---	--	--

Appointments by Department

Total Revenue by Department

Follow-Up Requirement Rate by Department

Average Waiting Days by Department

What can management improve based on this dashboard?

1. **Support High-Performing Departments**

- Neurology is the strongest department, with the highest number of appointments (273) and the highest revenue (\$66K). Additionally, this department has managed to keep its average waiting time to 271 days, which is lower than both the General and Orthopedics departments.
- Since Neurology is performing efficiently with lower wait times than some other departments, management should prioritize support for neurologists with enough rooms, staff, and administrative help to prevent burnout.

2. **Improve Capacity & Reduce Waiting Times**

- The General department has one of the longest waiting times (280 days) despite handling fewer patients than Neurology.
- Management should review staffing and workflow processes in the General department and consider shifting support staff there to reduce the backlog.
- Audit the patient process in General medicine to identify delays and inefficiencies.

3. **Improve Follow-Up Care & Patient Retention**

- Since General medicine heavily relies on patients coming back for continuity of care, create a distinct scheduling track. Block out specific times every week only for recommended follow-ups so these returning patients aren't waiting another 280 days for a check-up.
- Orthopedics is the only department where fewer than half of the patients (49.2%) receive a recommendation to return. Management should review whether providers are missing important recovery check-ups or post-treatment evaluations.

Patient Gender Analysis

Patients by Gender

Gender Distribution Across Departments

Average Appointment Cost by Gender

Follow-Up Requirement Rate by Gender

Average Waiting Days by Gender

What can management improve based on this dashboard?

1. **Fix Demographic Gaps & Improve Fairness**

- Increase staff or appointment capacity in the General and Orthopedics departments, since these areas have the longest waiting times and the highest number of female patients. This can help reduce the wait time gap between male and female patients.
- Improve the patient intake process by making demographic information mandatory during registration. Patients in the “Unknown” gender category experience the longest delays, which may be caused by incomplete records.
- Regularly monitor wait times by gender and department to quickly detect and fix inequality in service delivery.

2. **Improve Data Quality & Consistency**

- Billing is consistent across all genders, with very small differences in average appointment cost (\$221–\$237), which shows pricing and treatment processes are well standardized.
- Continue maintaining this consistency, but ensure better record-keeping for patients in the “Unknown” category to avoid incomplete data affecting operations.

3. **Strengthen Follow-Up Care**

- Since follow-up rates are similar for men and women (~51%), the same automated reminders and outreach systems can be used for both groups.
- Patients in the “Unknown” category have the highest need for follow-ups (56%) but also the worst delays. Front-desk staff should ensure full details are collected when booking follow-ups so these patients are not lost in the system.

Patient Age Group Analysis

Patients by Age Groups

Age Groups Distribution Across Departments

Average Appointment Cost by Age Groups

Follow-Up Requirement Rate by Age Groups

Average Waiting Days By Age Groups

What can management improve based on this dashboard?

1. **Implement Age-Prioritized Triage**

- Since older demographics (Seniors and Middle-Aged) are waiting the longest (around 280 days) and often suffer from more complex, time-sensitive chronic conditions, consider introducing a risk-based scheduling protocol that fast-tracks appointments for older groups in specialized fields like Neurology and Cardiology.
- Add more specialist staff or dedicated clinic hours for age groups with higher medical needs.

2. **Segment Retargeting Strategies**

- For Seniors, use simpler and more direct communication, like phone calls or caregiver notifications, to help them manage long wait times and follow-ups.
- For Young Adults, use SMS or app reminders to keep them engaged in recovery and follow-up care, especially after injuries or treatments.

3. **Revenue Optimization & Lifetime Value**

- Focus on keeping Young Adults engaged early, since many already need follow-up care and can become long-term patients. Ensure that the 52.8% of Young Adults who receive follow-up recommendations are successfully retained, establishing the clinic as their trusted, long-term healthcare partner as they age into other departments.
- Since Seniors generate high individual appointment costs (\$238) and have a high follow-up rate (54.6%), combine multiple check-ups (e.g., General + Cardiology) into one visit to reduce repeated appointments and improve efficiency for both patients and the clinic.
